

Vaping And Smoking → Health Impacts

- Smoking has been a huge risk factor of heart disease, but vaping has been used as an alternative over the past years. While it's seen as a healthy alternative we are still finding the long-term effects. The research will explore how behaviors like smoking and vaping compare with medical indicators like predicting heart disease.

Link 1 (12.86Kb): It contains 270 patient observations with 13 different predictable variables. The most interesting variables being the BP(numeric), Max Heart rate(numeric), and their number of vessels fluro(numeric) as these are strong clinical predictors. Exercise angina (categorical) and Chest pain Type(categorical) give insight into heart performance under stress. Heart disease is the target.

Link 2: Contains 65 patient observations with 16 different variables. The interesting variables are the chronic disease and lung cancer, they are both categorical variables.

- Questions?
 - Which factors have the highest influence on a person's risk of developing heart failure?
 - What specific age group are at the most risk?
 - Is there a relationship between cholesterol level and heart disease presence?

Serial Killers & Their Environment

- We'll be exploring the relationship between serial killers and their environment in which they were raised and operated. Analyzing multiple factors of social, economic, and psychological factors.

- Specifications ~

Link 1: Collected from ashioyajotham from Kaggle, sourced from wikipedia. The data is 305 KB. It contains 1500 observations and 4 variables. The variables being country, years active, proven victims, and possible victims.

Questions:

What years contained the most killings/ killers?

How do the confirmed victims compare to the possible victims.

How many killings are there per country?

Link 2: Collected by World Population Review. The data is 2.0 KB. It has 95 country observations and 1 variable (the number of serial killers) from two sources.

Questions:

What countries have the most serial killers?

Link 3: Data collected by Senthil Girmurugan and Terence Leary from Florida Gulf Coast University and Michael G. Aamodt from Radford University. This data is stored on researchgate.net . It contains many data sets containing variables such as sex, purpose, methods, decades, birth year, and abuse.

Questions:

How does abuse relate to serial killers?

What decade had the most killers?

How does sex relate to serial killers?

What purpose is the highest?

Climate Change and Pollution

→Health Impacts

- Climate change has been a growing issue for our society for a very long time. Even though the issue has been around for so many years, many people aren't educated on the health impacts that come along with it. The research we are conducting will explore this connection.

- Specifications ~
 - Link 1(400.95 mb) - Contains 135,000 observations with 28 different variables. The interesting variables are the measurements of the gasses in the atmosphere, they are numeric variables.
- Questions ~
 - What types of health complications can come along with air pollution?
